

NEMATODE MDH-LIKE SEQUENCES

ABSTRACT

Disclosed are two nucleic acid molecules from *M. incognita* encoding malate
5 dehydrogenase-like (MDH-like) polypeptides. The MDH-like polypeptide sequences are
also provided, as are vectors, host cells, and recombinant methods for production of MDH-
like nucleotides and polypeptides. The invention further relates to screening methods for
identifying inhibitors and/or activators, as well as methods for antibody production.
